The background of the slide is an aerial photograph of agricultural fields, likely a large-scale farm or plantation, with a white grid overlay. The fields are divided into rectangular plots. A central grey rectangular box contains the main title. The overall design uses a color palette of purples, blues, greens, and browns, which are reflected in the semi-transparent, overlapping trapezoidal shapes that form a funnel-like structure in the background.

A question of scale: the construction of marginal lands and the limitations of global land classifications

Paper presented at the International Conference on Global Land Grabbing
Land Deals Politics Initiative (LDPI) /Journal of Peasant Studies/ Future Agricultures Consortium
Institute of Development Studies, University of Sussex, 6-8 April 2011

**Rachel Nalepa
Boston University**

A green tractor is working in a field on a hillside. The hillside is covered with green grass and yellow-flowered bushes. The sky is blue with a few white clouds. The tractor is moving from left to right across the field.

What is the purpose of global assessments?

- © Global marginal land assessments are limited in distinguishing both suitable and available land for biofuels
- © serves to obscure socio-ecological relationships for the sake of creating a new “resource imaginary”

Characterizing Marginal Land

Step 1: **Suitability**

Climate, soil profile, topography (e.g. agro-climatic factors)

Step 2: **Availability**

Land cover data (discount land that is being used, can't be used)

Discount:

- Forest
- Wetlands
- Urbanscapes
- Cultivated Land
- Protected Areas

Some suitability data:

5 arc minute = ~10 km at equator

(agro-ecological data e.g. soil, terrain)

Cialla

Most suitability/availability data:

30 arc second = ~1 km at equator

Duseta

(agro-ecological data & land cover data)

Suitable (marginal?) land for biofuels in 6 Ethiopian regions

...land is “unusable”; it is “just marginal land.” The district administrator responsible for the project went on to say that “the whole thing [sic] is nothing but positive” (Knaup 2008).

	(ha)	for biofuels (ha)
Tigray	5,007,864	6,500
Oromia	35,3000,681	17,234,523
Benishangul Gumuz	4,928,946	3,128,251
SNNPR	11,234,319	49,025
Gambella	2,580,261	2,829,999
Amhara	15,917,366	966,535
		= ~20% nation's total land area
